Systems Analysis and Design 5th Edition

Program Design

Alan Dennis, Barbara Haley Wixom, and Roberta Roth

Chapter 10 Outline

- Moving from logical to physical process models.
- Designing programs.
- Structure chart.
- Program specification.

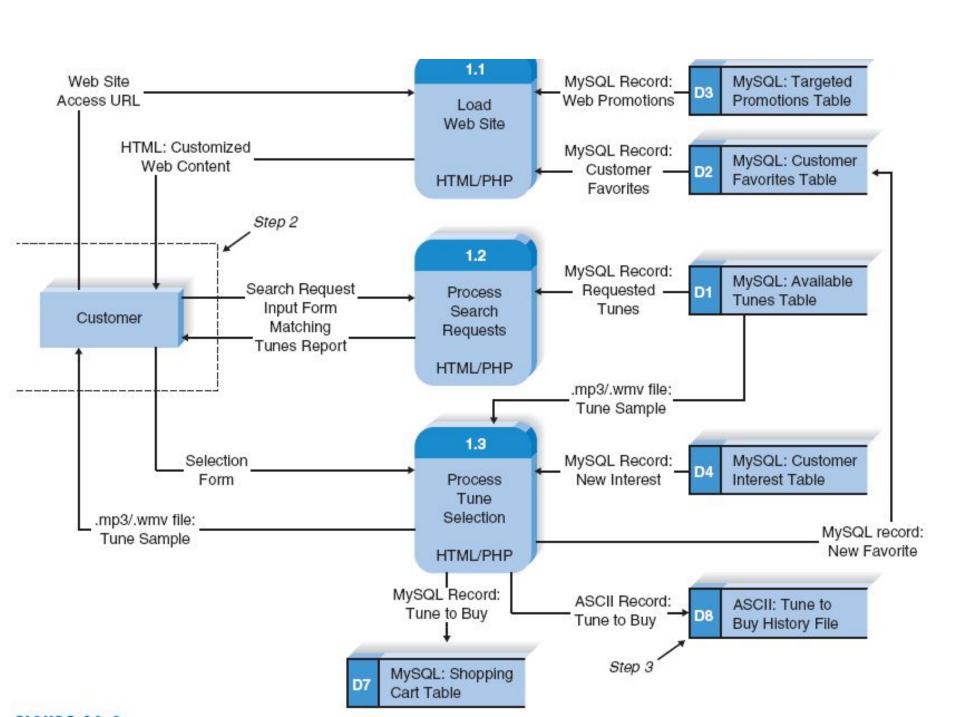

INTRODUCTION

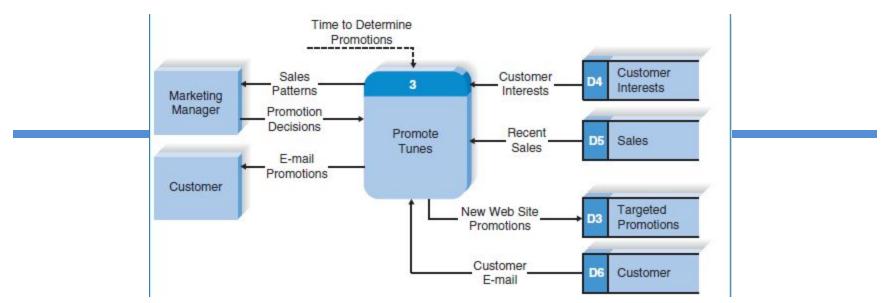

- Program design Analysts determine what programs will be written and create instructions for the programmers.
- Various implementation decisions are made about the new system (e.g., what programming language(s) will be used.)
- The DFDs created during analysis are modified to show these implementation decisions, resulting in a set of physical data flow diagrams.
- The analysts determine how the processes are organized, using a structure chart to depict the decisions.

Steps to Create the Physical Data Flow Diagram

Step	Explanation
Add implementation references.	Using the existing logical DFD, add the way in which the data stores, data flows, and processes will be implemented to each component.
Draw a human-machine boundary.	Draw a line to separate the automated parts of the system from the manual parts.
Add system-related data stores, data flows, and processes.	Add system-related data stores, data flows, and processes to the model (components that have little to do with the business process).
Update the data elements in the data flows.	Update the data flows to include system-related data elements.
Update the metadata in the CASE repository.	Update the metadata in the CASE repository to include physical characteristics.

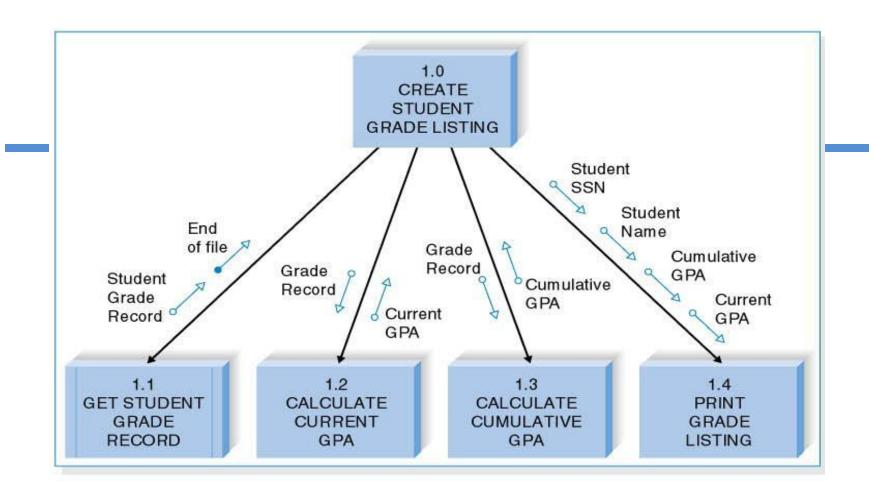

Logical Model of the Promote Tunes Process

STRUCTURE CHART

- The *structure chart* is an Important program design technique that help the analyst design the program.
- It shows all components of code in a hierarchical format that implies
 - Sequence (in what order components are invoked),
 - Selection (under what condition a module is invoked),
 - Iteration (how often a component is repeated)

An academic system needs a program that will print a listing of students along with their grade point averages (GPAs), both for the current semester and overall. First, the program must retrieve the student grade records; then it must calculate the current and cumulative GPAs; finally, the grade list can be printed.

a programmer can tell that there are four main code modules involved in creating a student grade listing: getting the student grade records, calculating current GPA, calculating cumulative GPA, and printing the listing. Also, there are various pieces of information that are either required by each module or created by it (e.g., the grade record, the cumulative GPA).

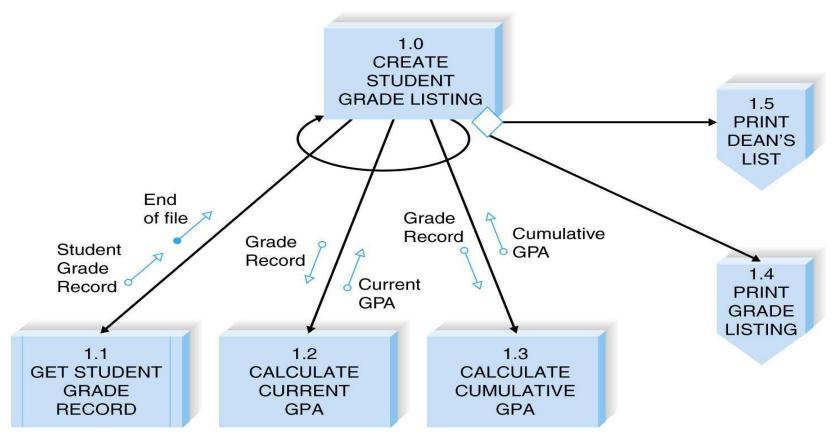

Structure Chart Element	Purpose	Symbol
Every module: • Has a number.	Denotes a logical piece of the program	
 Has a namec. Is a control module if it calls other modules below it. Is a subordinate module if it is controlled by a module at a higher level. 		1.2 CALCULATE CURRENT GPA
Every library module has: A number. A name. Multiple instances within a diagram.	Denotes a logical piece of the program that is repeated within the structure chart	1.1 GET STUDENT GRADE RECORD
A loop: Is drawn with a curved arrow. Is placed around lines of one or more modules that are repeated.	Communicates that a module(s) is repeated	
A conditional line: Is drawn with a diamond. includes modules that are invoked on the basis of some condition.	Communicates that subordinate modules are invoked by the control module based on some condition	
A data couple: Contains an arrow. Contains an empty circle. Names the type of data that are being passed. Can be passed up or down. Has a direction that is denoted by the arrow.	Communicates that data are being passed from one module to another Copyright 2011 John Wiley & Sons, I	grade record

(cont'd)

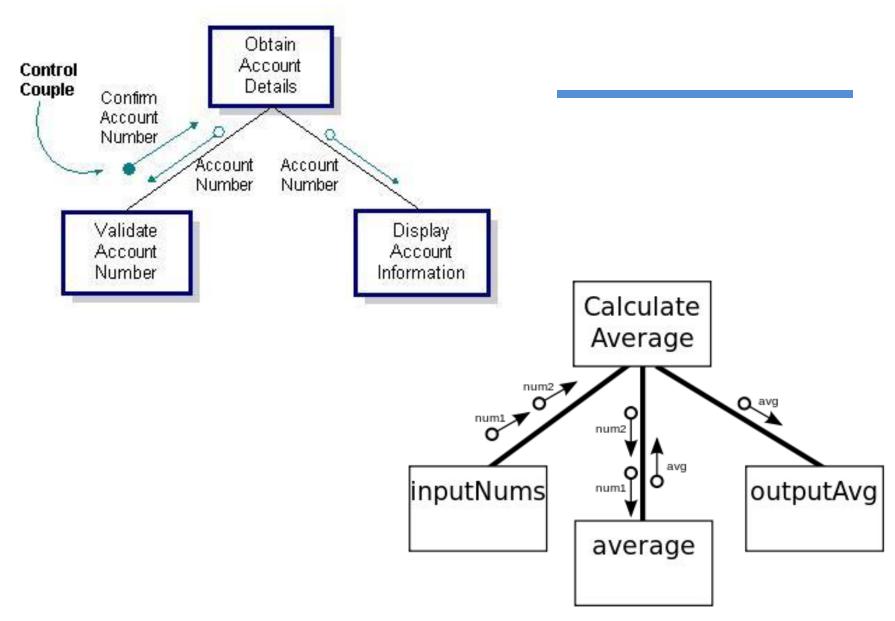

A control couple: Contains an arrow. Contains a filled-in circle. Names the message or flag that is being passed. Should be passed up, not down. Has a direction that is denoted by the arrow.	Communicates that a message or a system flag is being passed from one module to another	end of file
An off-page connector: Is denoted by the hexagon. Has a title. Is used when the diagram is too large to fit everything on the same page.	Identifies when parts of the diagram are continued on another page of the structure chart	PRINT GRADE LISTING
An on-page connector: Is denoted by the circle. Has a title. Is used when the diagram is too large to fit everything in the same spot on a page.	Identifies when parts of the diagram are continued somewhere else on the same page of the structure chart	PRINT GRADE LISTING

CONTROL COUPLE ON A STRUCTURE CHART

Design Guidelines

- High quality structure charts result in programs that are modular, reusable, and easy to implement.
- Measures of good design include
 - cohesion,
 - appropriate levels of fan-in and fan-out.

Build Modules with High Cohesion

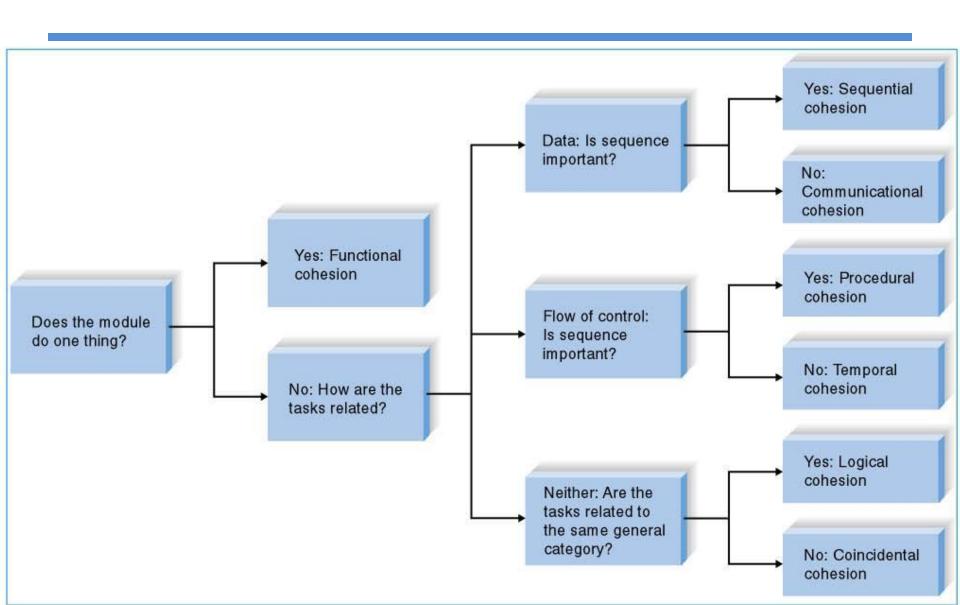

- **Cohesion** refers to how well the lines of code within each module relate to each other.
- Cohesive modules are easy to understand and build because their code performs one function effectively.

(cont'd)

- There are various types of cohesion.
- **Functional cohesion** − all elements of the modules contribute to performing a single task.
- Temporal cohesion functions are invoked at the same time.
- Coincidental cohesion wethere is no apparent -15

	Туре	Definition	Example
Good	Functional	Module performs one problem- related task	Calculate Current GPA The module calculates current GPA only
	Sequential	Output from one task is used by the next	Format and Validate Current GPA Two tasks are performed, and the formatted GPA from the first task is the input for the second task
	Communicational	Elements contribute to activities that use the same inputs or outputs	Calculate Current and Cumulative GPA Two tasks are performed because they both use the student grade record as input
	Procedural	Elements are performed in sequence but do not share data	Print Grade Listing The module includes the following: housekeeping, produce report
	Temporal	Activities are related in time	Initialize Program Variables Although the tasks occur at the same time, each task is unrelated
	Logical	List of activities; which one to per- form is chosen outside of module	Perform Customer Transaction This module will open a checking account, open a savings account, or calculate a loan, depending on the message that is sent by its control module
∀ Bad	Coincidental	No apparent relationship	Perform Activities This module performs different functions that have nothing to do with each other: update customer record, calculate loan payment, print exception report, analyze competitor pricing structure

Cohesion Decision Tree

Fan-In

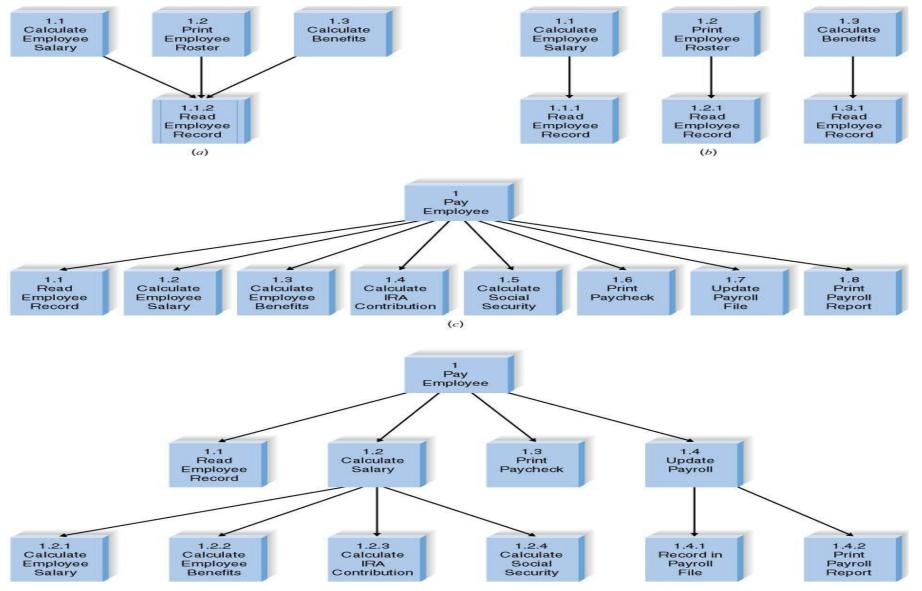

- Fan-in describes the number of control modules that communicate with a subordinate.
- A module with high fan-in has many different control modules that call it. This is a good situation because high fan-in indicates that a module is reused in many places on the structure chart.

Fan-Out

- A large number of subordinates associated with a single control should be avoided.
- The general rule of thumb is to limit a control module's subordinates to approximately seven for low fan-out.

- **fanin** is call by other modules.
 - Create High Fan-In
- **fanout** is call from that module.

Examples of Fan-in and Fan-out

Assess the Chart for Quality

Check list for structure chart quality

- ✓ Library modules have been created whenever possible.
- ✓ The diagram has a high fan-in structure.
- Control modules have no more than seven subordinates.
- ✓ Each module performs only one function (high cohesion).
- Modules sparingly share information (loose coupling).
- ✓ Data couples that are passed are actually used by the accepting module.
- Control couples are passed from "low to high."
- Each module has a reasonable amount of code associated with it.

PROGRAM SPECIFICATION

- Program Specifications are documents that include explicit instructions on how to program pieces of code.
- There is no formal syntax for program specification.
- Four components are essential for program specification:
- Program information;
- Events;
- Inputs and outputs; and
- Pseudocode a detailed outline of lines of code that need to be written.

Program Specification 1.1 for ABC System

Program Specification 1.1.2.2 for Digital Music Download System Module Find tune by Title Name: Purpose: Display basic tune information, using a title input by the user Progammer: John Smith Date due: April 26, 2009 OC ■ HTML/PHP ☐ Visual Basic □ Javascript Events . search by title push-button is clicked search by title hyperlink is selected Provided by: Input Name: Notes: Туре: Program 1.1.2 Tune title String (50) Output Name: Type: Used by Notes: Tune ID String (10) Program 1.1.2 Not found Logical Program 1.1.2 Used to communicate when tune is not found Pseudocode _ (Find_tune module) not found -True For all tune titles in Available Tunes table If user title matches tune title, save tune ID not-found = False End If End For Return Business rule: If no matching tunes are found, the "Artist of the week" will appear to the user. Note: A control couple containing a not _found flag should be included from 1.1.2.2 to 1.1.2 to

Instruct 1.1.2 to display a no Gourd in héisigh to the Luser land Wei Knyls Corsine Weel in C.

10-24

(cont'd)

Pseudocode Example

```
Calculate_discount_amount (total_price, discount_amount)

If total_price < 50 THEN

discount_amount = 0

ELSE

If total_price < 500 THEN

discount_amount = total_price *.10

ELSE

discount_amount = total_price *.20

END IF

END
```

SUMMARY

- Moving from logical to physical process models.
 - Physical DFDs show implementation details.
- Structure chart.
 - The structure chart shows all of the functional components needed in the program at a high level.
- Building structure chart.
 - Module, control connection, couples, review.
- Structure chart design guidelines.
 - Cohesion, coupling, and fan-in/fan-out.
- Program specifications. 11 John Wiley & Sons, Inc.
